

The Aster-P Project

Bringing Science to the Paranormal

People Appear Distressed by “Paranormal” Events

The Aster-P Project

www.asterpp.org

July 14, 2021

The Aster-P Project is an objective, non-partisan, grass roots organization working to apply practical science to real-world paranormal topics. The new collaborative is made up of interested skeptics and paranormal proponents *who yield to science*. APP expects to earn future affiliations through positive community interaction, adherence to the scientific method, and perpetually improving its methodology in both areas. No affiliations present as of this release.

Feedback and collaboration are welcome.

SIGNIFICANCE

As of late 2020, it appears likely that tens of thousands of people annually report being affected by *distressing* events labeled “paranormal.” Clearly, from an academic perspective the paranormal does not exist.

This introductory sample of public paranormal reports found remarkable percentages for: distress, ongoing events, mentions of the *word* skepticism, *lack of knowledge* of skeptical methods, and being distressed at *not knowing* what is happening. Therefore these results also served as a catalyst for a draft plan centered around educational outreach and structured skeptical/methodological discussion forums. (Educational self-help, hone this/related research, in-field measurement, *Micro-Environment Testing Apparatus* engineering).

Going forward, chances are minuscule for uncovering any phenomena that is new to science. However the prospect of assuaging thousands of peoples’ distress (yearly) is reason to proceed.

This is an open call for feedback on methodology guidelines, for this series and project-wide.

Keywords: Paranormal, Skeptic, Applied

ABSTRACT

Our first look at paranormal claims finds distressed people, likely upwards of ten-thousand yearly.

In *People Appear Distressed by “Paranormal” Events*, the first 100 of 1,003 paranormal reports were analyzed for 30 data points across 11 categories. Sources originated from one popular discussion forum during 34 days in late 2020.

The first 100 reports arrived in 2.94 days. When seasonal factors were considered, an estimate of over 10,000 posts per year could be expected on that *one* forum alone.

Of these reports, 60% indicated distress and 57% requested assistance. For every report, 1.72 people were affected. Primary concerns were unexplained events in peoples’ homes and unsettling sleep disturbances. Reports express skepticism at the same rate (27%) as paranormal belief (28%) but agnostic beliefs took the majority at 40%.

Measurable events were described in 26 of 100 reports: having ongoing and observable traits.

Analysis of the first 100 is released to encourage constructive feedback. Next steps include honing the *Paranormal Distress* research methodology for the remaining queue, and constructing an educational outreach resource to help distressed people find answers for *measurable* issues.

INTRODUCTION

Science is the backbone of civilization, the structure that organizes the sum total of all mankind's knowledge. Science is our vehicle for the constant advancement of humanity.

The “paranormal” is a laughingstock for the scientific community.

Yet with due respect to science, reputable polls repeatedly find widespread belief in the paranormal. Have people not gotten the message, or has the message not been effective?

Other contradictions: Paranormal anecdotes commonly self-describe as being skeptical, though even highly distressed claimants seem unaware that poor air quality can cause hallucinations. Paranormal proponents commonly ponder why science shuns the matter, while glossing over all the reasons that paranormal has historically failed to pass scientific scrutiny. To the common listener it appears that the paranormal is not sure where to even *begin* to apply science to their situation. Skeptical proponents routinely wonder why people do not just learn science.

Individuals who straddle the fence between “Believer” (Darkness Radio, 2021) and “Skeptic” (SGU, 2021) can be driven close to mad from these contradictions. Answers seem so close!

Many of the assumptions above come from sources that are difficult to quantify: podcasts for which transcripts are not readily available. However, the Internet's Reddit.com does host a paranormal forum with a constant flow of documented paranormal reports.

These documented reports *can* be quantified, to a reasonable extent, with a few caveats.

The question of whether assisting this demographic is worthwhile, may best be evaluated in context of four key points:

1. Are a lot of people *bothered* by “paranormal” events?
2. If so, what bothers people?
3. Are claimants open to skepticism?
4. Can any “paranormal events” be debunked/measured?

BACKGROUND

A. Are People Bothered?

A national poll in 2019 by YouGov.com found that 45% of Americans expressed belief in ghosts and/or demons. (Ballard, 2019). Of polls that charted general paranormal sentiment, between 2001 and 2018 numbers stayed within a close range: 71%-76%. As far as interaction with the paranormal, in 1996 The Pew Research Center found that 9% of Americans said they had *interacted* with a ghost. (Liu, 2009). By 2015 that number had risen to 18%. (Lipka, 2015).

Historically, the numbers appear to hold steady with fairly sizable percentages for paranormal beliefs. For “ghosts” specifically, some increase can be seen though it is not clear whether this increase is due to power of suggestion, de-stigmatization, or actual increase in activity.

Perhaps most well known among recent polls is Paranormal America 2018, part of The Chapman University Survey of American Fears (Wave 5). It also found that 75% of Americans believe in at least one paranormal topic but charted a larger belief in ghosts. (Chapman University, 2018).

2008	13%	--	Ipsos.com (2008)
2020	13%	--	FloridaRealtors.org (2020)

B. People Believe, But Are They Distressed?

Fear and/or distress is not mentioned in the surveys above.

A Google Scholar search for “paranormal+fear” returned over 17,700 results through 2020; “paranormal+distress” returned 10,700+ results. This considerable pool of results requires an efficient triage system for relevant material. One immediate standout acknowledged *yes and no*:

“Although 45% of the respondents indicated that a paranormal experience had made them very afraid, this fear appeared to be temporary or mixed with positive feeling because only 9% indicated that their experiences have been scary with no positive value.” (Kennedy & Kanthamani, 1995).

B. People Believe, But Are They Distressed? (continued)

Other public research aggregators returned more manageable pools of results. PLOS ONE returned 31 results for “paranormal+fear” and 11 for “paranormal+distress.” PubMed returned 15 and 7, respectively. A far greater proportion of these seem to hold opportunity for relevance.

However this discussion may be premature. The primary focus here is *measurable unexplained* events labeled “paranormal.” What is clear among browsed papers is a common assumption that the paranormal component is psychologically manufactured or otherwise not “unexplained.” Five of the seven results for “paranormal+distress” from PubMed had some variant of the word “psychosis” in the title. The other two articles concerned sleep paralysis and ESP. Many of the works from other aggregators generally center around psychology (beliefs and delusions). Mental disorders are outside the scope of our research here, although these resources will be helpful for creating a plan (of referral) for next steps if/when debunking fails.

Two initial standouts include *Clinical Features of Isolated Sleep Paralysis* (Sharpless & Kliková, 2019) and *Measuring Extraordinary Experiences and Beliefs: A Validation and Reliability Study* (Wahbeh et al, 2019). Also, several pieces of work concerning the paranormal+fear and mental disorders, by James Houran and Rense Lange, are of interest. However access to *The Journal of Nervous and Mental Disease* appears limited at this time.

Many more are also relevant, though not immediately for *quantifying* fear and paranormal. As for the entirety of work on paranormal and fear/distress, we welcome feedback on *quantifying*; and also in mining other relevant material from this fertile pool.

C. What is Bothering People?

An academic dive into literature is mired in psychology. Polls are primarily concerned with belief, not *fear*, though traditionally being “scary” is an inherent trait of the paranormal trope. The Chapman University (2018) study *Paranormal America* listed beliefs in ghosts at 57%, aliens 35%, and bigfoot at 26%. Other *academic* material is not immediately apparent for what exactly is disturbing people in reports of paranormal events. Much publicly available anecdotal evidence has not been documented and/or analyzed.

Similarly, for questions about skepticism and debunking, good research is elusive. Therefore we ask another relevant question: Is fear of the paranormal (“unexplained” experiences) legitimate?

D. Is Fear of the Unknown Legitimate?

In considering whether educational outreach might be worthwhile, we examined whether the fear of the 45% is likely legitimate. Can this fear be ethically ignored by learned bystanders?

The search terms “fear of dark” and “phobia” combined with “legitimate fear” seemed to best fit this question. Both are also considered irrational fears, fairly common, and well known to psychology. PubMed returned 0 and 4 respectively, through 2020. PLOS ONE returned 1 and 8 respectively. None appeared relevant. Google Scholar returned 178 and 18,800+, respectively.

D. Is Fear of the Unknown Legitimate? (continued)

Cambridge University philosopher William Lyons' well-regarded work *Emotion* (1980) supported the idea that fear of the dark is legitimate fear:

*“Fear and cognate emotions such as fright are usually described as evaluating their object, at least in part, as dangerous to the person concerned. Now, if this is correct, it would not seem strange for there to be a fear which might evaluate one’s very ignorance of the situation, a lack of knowledge, one’s not knowing anything about the object, as dangerous. Thus fear of the dark may not be fear of the absence of light but fear of the absence of knowledge or, to put it more exactly, fear arising because one does not know what might be out there in the dark and because one thinks that there might be something to injure or startle one. ...
...Another possibility is that some cases of so-called objectless fears might be cases of foreboding, a vague feeling that some doom is about to befall one. Here the object is just vague rather than absent but it is still an object.”* (Lyons, 1980).

Further supporting the idea that fear of the unknown is legitimate, a widely cited 2001 paper published in the American Psychological Association’s *Psychological Review* describes phobias in tandem with other real fears. From *Fears, phobias, and preparedness: toward an evolved module of fear and fear learning*:

“Viewed from the evolutionary perspective, fear is central to mammalian evolution. As a product of natural selection, it is shaped and constrained by evolutionary contingencies. It is a central thesis of this article that this evolutionary history is obvious in the fear and phobias exhibited and readily learned by humans. We are more likely to fear events and situations that provided threats to the survival of our ancestors, such as potentially deadly predators, heights, and wide open spaces, than to fear the most frequently encountered potentially deadly objects in our contemporary environment, such as weapons or motorcycles [e.g., Marks, 1969; Seligman, 1971]. (Ohman & Mineka, 2001).

Much of the academic data concerning the paranormal is imprecise for our area of interest. Much data exists in paranormal enclaves, however it is largely anecdotal and less likely documented. Future studies may uncover more and better data, and better categorization.

For now, academic evidence seems to support widespread belief in the paranormal, most likely “ghosts,” upwards of 45% feeling (short term) fear, and that fear of the unknown is legitimate.

This background will be expanded in future works and in our ongoing methodology forums.

METHOD

A. Sample

The focus here is to find out in a general sense if a lot of people are distressed and if so, why.

One popular internet forum was selected, Reddit.com's r/paranormal. Reddit.com is a longstanding popular social media website which operates primarily on the written word. It was ranked #15 in social media platforms worldwide for 2020, with 430 million active users. (Tankovska, 2021a). The site's demographics skew toward college-educated U.S. (49%) males with an average age of 25. (Tankovska, 2021b). As of March 2021 the forum r/paranormal listed 808k subscribers and was ranked #529 site-wide for subscribers. (SubredditStats.com. 2021).

A total of 1,003 reports, filed in under 34 days, were queued as the original study sample. This paper summarizes the results of the first 100 reports. Releasing the first round results allows opportunity for feedback on methodology before analyzing the remaining 90% of the sample queue. The remainder will be completed in Spring 2021. (A directed survey is planned also. See Appendix 6 – Draft Outreach Plan.)

B. Sample Organization and Storage

The source data of 1,003 posts were organized by the original index picture. At a rate of about 12 posts per index pic, there were 77 index pictures. Each index picture has a corresponding folder which houses that pic and the associated individual links / hard copy PDFs. This data is available for download and includes a readme file to explain the organization better. (Table 3).

All study materials are available to view at www.asterpp.org/study1. This includes spreadsheets of raw data tables, organized links to all 100 sources (individual reports), source PDFs, full paper, and all appendices.

C. Data Collection

Each of the 100 posts was documented to PDF. Then each post was systematically documented in a spreadsheet as surveyed against 97 data points across 11 categories. (Table 4).

Disqualified and Not-Applicable Reports

Two of the first 100 posts were disqualified. These posts had been deleted between the time the list was generated and the printing of reports for analysis. Four other posts were not paranormal reports but paranormal discussions. These were not *disqualified*, as they could be documented. But there was no report to analyze. These were designated as "N/A."

For these six posts/reports, the next ones in queue were dropped in, to keep the sample at 100 paranormal reports analyzed.

D. Controls

With respect to the caveats below, effort was put into obtaining unbiased results. Among these:

- Sample size set without regard to content.
- Full queue size 1,003 or just over a month's worth of complete data.
- Have a demonstrable reason for positive marks (many judgment calls unfortunately).
- Not reading too much into results (pitfall with judgments on ambiguous criteria).
- Each post printed-to-PDF and compiled to preserve the sample for independent review.
- Second pass review of entries. (Double-checked these 100 and their results.)
- Appendix 5 shows all survey criteria, from spreadsheets, with links to original sources.

E. Caveats

A number of caveats are acknowledged:

1. A study such as this is inherently subjective, even considering the fluidity of anecdotes and the soft sciences in general. This study is not even a directed self-survey, but one in which an analyst must make judgments about anecdotes. Deviations might occur in replication, though blind objectivity is every analyst's goal. (To mitigate this, the sample of 100 was analyzed twice. The remaining queue will have multiple analysts/analysis.)
2. Details were often incomplete or ambiguous. (A directed survey is in development.)
3. It is unclear how many of these reports were made in good faith.
4. The use of AI has been prevalent in mainstream journalism for several years already. (Martin, 2019). Independent and oblivious of this fact, our analyst noticed *repeated* striking similarities in reports, as the sample was analyzed one "data source page" at a time (10-12 reports). While not formally quantified, this did happen several times – enough to shine extra scrutiny on the "public comments" category of these reports. In several of these cases the original poster (OP) engaged in commentary, easing the red flag. Some of these cases may be merely the power of suggestion, a reader reminded one of their own experiences. It is not unreasonable to suspect and watch for AI reports. Vigilance and verification may mitigate this risk. For the remaining queue, situations of striking similarity will be noted for consideration.

F. Privacy and Fair Use

Reddit.com and its subsidiary "r/paranormal" are public-facing entities. Even so, efforts were taken in this study to identify reports only by their number in the study queue, not their verbatim title. Also, in the raw data tables (Appendix 5) the titles were removed from each entry. However, diligent researchers who download the actual data files from our website will find the PDF hard copies and links to sources. Links contain post titles. We believe we have taken reasonable precautions for the privacy of individual reports while documenting our sources for review. We believe our study constitutes fair use of source content and reasonably protects the OP's privacy.

RESULTS AND DISCUSSION

The eleven categories of data sets:

- A. People Affected
- B. Report Descriptors
- C. Skepticism
- D. Debunking Efforts
- E. Reported Outcomes
- F. Location of Events
- G. Times of Event and Past/Recent/Ongoing
- H. Frequency of Events
- I. Public Commentary
- J. Measurable (theoretically testable) Reports
- K. Remarkable Reports

A. People Affected

This is the biggest category, with six separate data sets (tables).

1. Frequency of Reports

Are there a lot of reports? Round one's random block of 100 reports were posted within 3.06 days, 11/29/20-12/02/20. This is an average rate of 1.42 per hour, or 12,397 per year. (Table 5).

This sample (round one) and the entire queue of 1,003 were posted 11/29/20-01/02/20 in 33.36 days. That is 10,952 per year, a big decline from the R1 figure. Further lowering any average are holiday stress and traditional winter blues. On top of these, social distancing sees more people isolated at home. These factors point to a high average, even at 10,952.

However this is just one internet forum. Dozens exist. Also, people have experiences and document it elsewhere – or nowhere. It is not clear what fraction of all worldwide reports this sample represents. See section L. *Sample In Context* for more on this.

2. Number of People Affected

Are many people affected? In 100 reports, 172 people were described as affected by the event. That is an average of 1.72 people affected per report.

All but four posts were of one (54%), two (29%), or three (13%) people affected. The remaining four posts had one group of four, two groups of five, and a group of seven. (Table 6).

3. Purpose of Report

Why was a report made? The numbers were split with 57% wanting some kind of assistance (help, advice, explanations) and 43% merely wanting to relay a story about an event. (Table 7).

A. People Affected (continued)

4. Reaction: Fear/Upset/Curious

What was peoples' reaction to the event? Fear is a common trope for the paranormal, but fear came in third behind "upset" and "curious." (Table 8). Broadly, 60% of people were distressed by the reported event, either upset (47%) or fearful (13%). A quarter more (27%) were curious enough to seek explanations on a public forum. Otherwise, 9% were unfazed and 4% were glad the event happened.

Defining what made people fearful or upset is not simple. Besides descriptors (keywords) that list specific disturbances, some survey criteria point to several factors for peoples' anxiety.

Survey parameters for the 13 "fear" reports can be seen in Appendix 2 – "Fear" Reports Isolated.

5. Reason for Reaction (and/or distress)

To describe the *cause* of their reaction, each post earned a keyword or two as seen in Table 9. Most of the keywords were unique for "fear" and "upset." One keyword stands out. In "upset" 11 people described their reaction as caused by "mystery." The runners up, at three reports each, were "frightened" and "nightmare." In "fear" all were different except two were "antagonizing." (Table 10).

This analysis is extremely subjective. Upon analysis and writing the paper, this category stood out as one which needs more care in the remaining sample queue. These descriptions are the root of peoples' distress (fear). For the rest of the queue, this should be more clearly described.

Looking at the keywords and their distribution, the majority of people were either doggedly curious *about something mysterious that happened to them* or they felt threatened. Though the study did not track the number, there were very few (described) where people *encouraged* issues.

6. Interacted or Observed

An interactive event was described in 40% of reports. Another 26% *might* have been interactive. A third, 34% were purely observations. (Table 11). Separately, many people describe feeling actively menaced, but a few interactions were positive. This will be quantified better in Study #2.

B. Report Descriptors

What is bothering people? Each report was given 1-8 descriptors, key words to describe the event. Round one used 87 unique descriptors, a total of 337 times. Descriptors were categorized by paranormal phenomena claimed, observable traits, and other qualifiers as they came up.

The top ten descriptors overall were: Audio (38%), visual (33%), movement (21%), body (15%), dream (15%), sleep paralysis (12%), animal, pets (12%), electrical (12%), shadow (11%), and ghost (10%). All descriptors by frequency are shown in Table 12, and by category in Table 13.

C. Skepticism

Do people express skepticism at all? Yes. Of all explanations given by the report author, agnostic explanations at 40% were the biggest percentage. (Table 14). Skeptical and paranormal explanations each accounted for an almost equal quarter of guesses, 27% and 28% respectively. Eight reports were only an accounting of events without putting forth any guess. Reports offered multiple guesses. A total of 173 explanations were offered (skeptical, agnostic, paranormal) plus the 8 no-guess reports. Non-paranormal explanations accounted for 67% of guesses.

Considering distribution (Table 15), non-paranormal explanations were seen in 51% of reports. Less than the majority of *paranormal reports* actually considered the event “paranormal.”

Reports did repeatedly describe an unexpected, unexplained, and unsettling event. That people thought of a paranormal forum as their last resort may indicate a failure of skeptical education, not necessarily closed minds to skepticism.

D. Debunking Efforts

Debunking was attempted in 24 reports, with 6 describing a number of things the author did to try to debunk the event. The rest, 18%, were cursory attempts at debunking. One effort was successful. (Table 16). Especially report #72, some people debunked to their best effort, without success. This possibly illustrates that skeptical knowledge is not reaching these people.

E. Reported Outcomes

In 40% of reports, no outcome is possible because the occurrence is (supposedly) ongoing. Otherwise, the one-off nature of 31% of events prevented the person from finding an explanation. In 16% of reports no answer was described. Other outcomes: paranormal (4%), moved (5%), skeptical (2%), and (2%) resolved on its own. (Table 17).

F. Location of Events

Few reports mentioned geographic location, except a couple that mentioned living near the “Bridgewater Triangle.” All but two were at a residence, though this was not a data point. Between indoor/outdoor, overwhelmingly reported events occurred indoors (79%). (Table 18).

G. Times of Event and Past/Recent/Ongoing

More events occurred at night (42%) than day (16%) or both (13%); 29% did not say. (Table 19).

Separately, almost a third (29%) of the reports described a past event. (Table 20). These may be a large part of the people who, in *Purpose of Post*, said they only came to tell a story, not seek assistance. The rest of the two-thirds were split between recent (30%) and ongoing (40%) events.

H. Frequency of Events

More instances of multiple occurrences (59%) were seen than one-time events (41%). (Table 21). Multiple instances are advantageous for measurement and debunking.

I. Public Commentary to the Reports

These reports were posted to Reddit, therefore people commented. This public commentary was also surveyed for many of the same criteria as well as advice given/taken. (Table 22).

Explanations guessed were again split evenly between paranormal and skeptical, with skepticism having a slight edge at 51% over paranormal's 49% of guesses.

Advice was given half of the time in both directions, either paranormal (51%) or skeptical (48%). Advice was considered exactly evenly at 28% in either direction.

Perhaps the biggest takeaway is the amount of similar experiences. Half of the reports (51%) included comments which expressed similar experiences at least once (31%) if not more (20%).

J. Measurable Reports

This is one of the biggest takeaways of the study. Out of 100 reports, 26 indicated conditions that were both observable and repeatable. (Table 23). This is in addition to air quality monitoring.

To be measurable an event must be ongoing and observable in some way.

Recall Table 20 – Past/Present/Ongoing (Section G) gave a parameter for “on-going:” 40%.

Recall Table 12 – Report Descriptors (Section B) gave parameters for observable traits. These are shown isolated in Table 24, *Observable Descriptors*. (Audio, visual, movement, electrical and shadow were most prevalent.) These are more difficult to apply, as some percentages overlap.

In addition to Report Descriptors each measurable report got a unique extra description to clarify what exactly is (reported as) observable. (Table 25). Most measurable reports would benefit from a General Surveillance Plan (GSP) meaning a secure A/V home security system like Ring, Inc.'s program which uploads raw footage to a cloud. Most reports indicate a specific event that occurs.

The 26 measurable reports were also summarized and their survey parameters isolated for viewing, in Appendix 3 – Measurable Reports Examination.

Diving into these reports would be an undertaking in itself, one which would require the input of various experts. Coupled with the informal nature of these particular reports, this discussion is best left for a forum where nuances can be explored and methodology can be determined. It would be of benefit to use a clean sample queue of claimants that could be more tightly controlled. Even better would be participating claimants, to assist with follow-up questions.

K. Remarkable Reports

The last category examined was remarkable reports. (Table 26). There were 25 reports remarkable in some way, independent of measurability. (Not all testable reports are remarkable.)

The scope of the paper is limited to the demographics of paranormal reports. These were not intended to be explored, but noted. These 25 reports are detailed in Appendix 4 – Remarkable Reports Examination. Table 27 is a quick look at why these reports were remarkable.

Table 27

Remarkable Reports Reason and Testability

<u>P#</u>	<u>T</u>	<u>Reason post is remarkable</u>
9	/	May be of interest to ESP studies.
11	/	Good example of common report, hits many benchmarks.
16	Y	Skeptic even though appears has a history of un-debunkable events.
23	/	Good example of common report, sounds like air quality issue.
26	/	May be of interest to ESP studies.
27	/	Good example of common report, sounds like air quality issue.
28	/	Dual hallucination.
29	/	Seems irrefutable but not provable.
32	Y	Seems interactive.
33	Y	Secure environment; Surveillance already in place.
38	/	So many holes but extremely compelling.
39	/	Lots going on here. Seems interactive.
44	Y	Moved objects, to reappear in odd places; Recurring.
45	Y	OP asks for help with ridiculous claim that happens to be highly measurable.
51	/	Physical anomalies/coincidences. Time lost.
52	Y	Not a hint of skepticism.
64	Y	Interactive ESP with others.
65	Y	Requests help; in distress.
70	M	Easy to mistake for paranormal. Obscure natural explanation is likely.
71	Y	Movement, also interactive. Ongoing. Likely air quality issue.
72	/	Tried to debunk; Unsuccessful.
76	/	Video call anomaly.
88	Y	Movement. Possibly visual. Ongoing.
96	/	Interactive.
100	/	Example of common complaint having an obscure natural explanation.

L. Sample in Context

Taken together, the adjusted frequency of reports and number of people affected and distressed, suggest at least 7,500 distressed people a year *from this one internet forum*. It is ranked #15 for social media outlets. National polls suggest wide popularity of paranormal. It is plausible dozens of other SM would show similar results. Podcasts are another popular outlet, which are similarly full of reports. Only English language internet-based outlets have been considered so far, though paranormal is popular worldwide. (Romano, 2020). All of this together suggests there may be at least “tens of thousands of distressed people” worldwide. (Table 28).

OPTIONS FOR ASSISTANCE

A. Outline the problem

People seem bothered by intrusive events they cannot explain. Skeptical resources are abundant. Are people not aware of debunking information, or is it not working for them?

Environmental gadgets are cheap and many, but skeptics say people do not use these items effectively. Regardless, gadgets do not appear to have been used by any people in this study.

Mentions of carbon monoxide or mold were nil. Do people not know that these can cause hallucinations, or that these detectors cost under \$10 a piece at Amazon or Home Depot?

B. Options

The best option may be a combination of education, advertising, and cooperation between “experiencers” and skeptics to figure out tough debunking cases.

- Detailed but easy-to-read debunking information could be made *readily* available to those who experience “paranormal” events, through an inexpensive website.
- Social media advertising is cheap, and can easily reach the masses. (WebFX, 2021).
- Interested arm-chair skeptics could follow up by making sure the information is working.
- Interested professional skeptics could work WITH paranormal investigators (by teaching) instead of against them (by criticizing).
- Methodology forums could parse out stubborn cases and solidify best investigative practices, for paranormal researchers to take into the field if self-debunking fails.
- A popular subject, such an endeavor may be self-sustaining through donations.

Conversely, knowledgeable parties could continue to ignore the situation, as the people will handle these things regardless of help. After all, science’s front-facing opinion is dismissive. This quote is displayed on the public’s favorite fact checking source, Wikipedia: (Paranormal, 2021).

“The psychologist David Marks wrote that paranormal phenomena can be explained by magical thinking, mental imagery, subjective validation, coincidence, hidden causes, and fraud.”

Closer to the first option, something of a long term plan has been drafted to address the conflict. Because it is not directly relevant to the study of paranormal reports, discussion of this plan is seen in Appendix 6 – Draft Outreach Plan.

CONCLUSION

In under 34 days late last year, 1,003 paranormal reports were filed to one outlet. Adjusted, that rate would assume over 10,000 per year, to *just one* internet discussion forum. It is unclear how many of these reports were made in good faith. However this study presumes that science will stipulate to fairly widespread public belief in paranormal topics. We proceeded with that caveat.

In the first 100 reports there were no mentions of UFOs, Bigfoot, or various skeptical prizes for paranormal evidence. Primarily referenced were disturbing unexplained events in peoples' homes.

- Over half (60%) expressed distress.
- Over half (57%) requested assistance with the matter.
- For every report an average of 1.72 people were affected.
- Almost two-thirds (67%) expressed skepticism and agnostic beliefs.
- Closer to half but not quite, 40% described ongoing events.
- Over a quarter (26%) of the reports described measurable (observable/repeatable) events.
- Three-quarters of Americans believe in at least one paranormal topic.

This data being mired in caveats is a primary concern when planning next steps. Ninety-percent of the queue has yet to be analyzed. Some feedback has been generated already. Immediate steps include more feedback, to hone the methodology of this *Recent Paranormal Claims* series.

The plethora of skeptical material on psychological explanations, indeed the skeptical movement itself, speaks to the *scientifically accepted fact* that a large portion of the public truly believes the paranormal stories they swap. From the aggregate of reports studied here, many people appear genuinely distressed by “paranormal” events. Are people not getting the message or is the message ineffective? This will be explored further, in this series and in open discussion.

Air quality is close to the top of skeptical explanations, yet none of the first 100 paranormal reports mentioned this as an explanation. Also, over a quarter of reports offer *measurable* events. Currently, considering claimants' openness to a skeptical approach, a next-stage might look like the draft plan proposed in Appendix 6. An intermediary between these two camps that have become echo chambers, to include educational public outreach and an organized bank of methodology forums, seems a prudent course of action.

Dismissive mockery is not helpful to the likely tens of thousands of people each year who are bothered by things that science says do not exist. At the same time, the onus is on the believers to provide extraordinary evidence for their extraordinary claims.

Next steps include soliciting feedback to hone the methodology of every facet of the draft plan. This includes (the remaining queue of 1,003 reports), the *review-ready* directed survey, and the public-facing website which contains (beginning) debunking tips and organized methodology forums. Further steps include steadily implementing enlightened feedback, for the end goal of lessening the public's paranormal distress via science. Throughout these processes, the endeavor need not condescend.

APP Study #1 Results Summary

A block of 100 reports posted to one popular paranormal outlet between 11/29/20 and 12/02/20, was surveyed by the Aster-P Project in February 2021, and yielded the following results:

Study Stats		Location of Event		Fear or Upset	
Total Posts	106	Indoor	79	Fear	13 60
Deleted by OP (DQ)	2	Outdoor	9	Upset	47
Not Reports (N/A)	4	Both	5	Curious	27
Round one reports	100	Vehicle	5	Glad	4
Time to fill (hrs)	73.5	Did not specify	2	Unfazed	9
People Affected	172		100		60
Measurable Reports		Purpose of Report		Interacted or Observed	
Repeatable	40	Help	8 57	Interactive	40
Observable	54	Advice	24	Observation	34
Measurable Reports	26	What is this?	25	Not sure	26
Remarkable Reports		Tell their story	43		100
Measurable	26		100		
Remarkable	25	Frequency of Events		Debunking Efforts	
Both	11	1x	41	Cursory effort	18
Remarkable Reports	25	2x +	59	Thoughtful effort	6
Top Descriptors			100	Successful	1
Audio	38	Past / Recent / On-going		Time of Event	
Visual	33	Ongoing	40	Day	16
Movement	21	Recent	30	Night	42
Body	15	Past	29	Both	13
Dream	15	Did not specify	1	Did not specify	29
Sleep paralysis	12		100		100
Animal, pets	12	All Guesses		Outcome of Event	
Electrical	12	Paranormal	49	Paranormal resolve	4
Shadow	11	Skeptical	47	Skeptical resolve	2
Ghost	10	Agnostic	69	Only happened once	31
Moved object	8	No guess	8	Ongoing – no resolve	40
Dream, AFTL	6	(multiple choices)	173	Moved	5
Follow	6	Outcome of Event		Resolved on its own	2
Doppelganger	5			Did not specify	16
Shadow person	5				100
ESP	5				
Door	5				
(multiple choices)	219

Total	26	100.0%

Table26

Remarkable Reports

<u>Parameter</u>	<u>n</u>	<u>%</u>
Remarkable reports	25	25%
Measurable reports	26	26%
Both remarkable and measurable	11	11%

Table 27

Remarkable Reports – Reason and Testability (T)

<u>P#</u>	<u>T</u>	<u>Reason Post Is Remarkable</u>
9	/	May be of interest to ESP studies.
11	/	Good example of common report, hits many benchmarks.
16	Y	Skeptic even though appears has a history of un-debunkable events.
23	/	Good example of common report, sounds like air quality issue.
26	/	May be of interest to ESP studies.
27	/	Good example of common report, sounds like air quality issue.
28	/	Dual hallucination.
29	/	Seems irrefutable but not provable.
32	Y	Seems interactive.
33	Y	Secure environment; Surveillance already in place.
38	/	So many holes but extremely compelling.
39	/	Lots going on here. Seems interactive.
44	Y	Moved objects, to reappear in odd places; Recurring.
45	Y	OP asks for help with ridiculous claim that happens to be highly measurable.
51	/	Physical anomalies/coincidences. Time lost.
52	Y	Not a hint of skepticism.
64	Y	Interactive ESP with others.
65	Y	Requests help; in distress.
70	M	Easy to mistake for paranormal. Obscure natural explanation is likely.
71	Y	Movement, also interactive. Ongoing. Likely air quality issue.
72	/	Tried to debunk; Unsuccessful.
76	/	Video call anomaly.
88	Y	Movement. Possibly visual. Ongoing.
96	/	Interactive.
100	/	Example of common complaint having an obscure natural explanation.

Table 28

Sample In Context – Affected and Distressed People

AFFECTED PEOPLE			
<u>Parameter</u>		<u>Value</u>	<u>Balance</u>
Start			0
First round yearly estimate		12,397	12,397
Full queue yearly estimate		10,952	10,952
Further adj down for summertime advantages		8,000	8,000
Yearly reports from the 15 th most popular SM site		=	8,000
People affected rate		1.72	13,760
Request assistance rate		57%	7,843
Request assistance yearly from the 15th most popular SM site		=	7,843
Add yearly rate from the 14 more popular Social Media sites		?	
Add yearly rate from less popular SM sites		?

Table A1

Scientific Explanations

<u>Live Science 2015</u>	<u>Scientific American 2019</u>	<u>Popular Science 2020</u>
Infrasound	Low frequency sound	You want to believe
Electromagnetic energy	Mold	You'd rather not risk it
Power of suggestion	Carbon monoxide	You need a little company
Misunderstand ambiguous events	The power of suggestion	Your brain is unwell
Optical illusions	Drafts	You're getting some bad vibrations
False memories	We enjoy being afraid	You're in the wrong place / wrong time
		Your mind is playing tricks on itself

Sources: Scientific American (Stierwalt, 2019); Live Science 2015 (Pappas, 2015); Popular Science (Bittle, 2020).

Table A2

Psychological Explanations

<u>Brain Fails</u>	<u>Thinking Fails</u>	<u>Bad Science</u>
1 False Memory	7 Dunning-Kruger Effect	17 Methodological Naturalism
2 Bad Perception	8 Motivated Reasoning	18 Postmodernism
3 Pareidolia	9 Logical Fallacies	19 Occam's Razor
4 Hyperactive Agency Detection	10 Cognitive Biases	20 Pseudoscience
5 Hypnagogia	11 Appeal to Antiquity	21 Denialism
6 Ideomotor Effect	12 Appeal to Nature	22 P-Hacking
	13 Fundamental Attribution Error	23 Placebo Effects
	14 Anomaly Hunting	24 Anecdote
	15 Data Mining	
	16 Coincidence

Table A9

Investigator Certification

Objective

- Recognize the legitimacy
- Difference between science and paranormal
- Literature review and peer review
- Scientific answers
- Check lists
- Methodology
- Controlling in the field
 - Visual
 - Audio
 - Movement
 - Environment
- Documentation for the next team
- Rework methodology and re-measure

Measurable Reports Examination

APPENDIX 3 Measurable Reports Examination.....	62
I. Recall Relevant Tables.....	62
II. Measurable Reports Summary.....	63 - 69
III. Raw Data Spreadsheet, Measurable Reports.....	70 - 81

Recall Relevant Tables:

Table 23 Measurable Reports.....	42
Table 24 Observable Descriptors.....	43
Table 25 What is Measurable.....	43

Appendix 3 - Measurable Reports Summary

#4	Ghost, Movement; Audio; Door	Observable: Y	Repeatable: Y	Remarkable: N
Background:	Lifelong tacit observation, family related, sporadic events. Recent activity increasing in scope and frequency.			
Biggest claim:	Cooler moved across floor.			
Skeptical:	Predisposition to inkblots. Power of suggestion.			
Measurement:	GSP			
#8	Ghost; Movement; Audio; Moved objects	Observable: Y	Repeatable: Y	Remarkable: N
Background:	Several college students in an apartment report missing or moved objects, strange noises.			
Biggest claim:	Objects reappear.			
Skeptical:	Someone has an undiscovered or forgotten key.			
Measurement:	GSP			
#13	Doppelganger; Poltergeist; Shadow; Pre-fear; Air B&B; Audio; Dream; Salt	Observable: Y	Repeatable: Y	Remarkable: Y
Background:	Group of friends reports bizarre, aggressively interactive dreams at an Air B&B.			
Biggest claim:	Bizarre, aggressively interactive dreams. May interest para-psychology (ESP) studies.			
Skeptical:	Dreams? Really?			
Measurement:	GSP; Directed study; Send in a sample for “greater than random” uncompromised reports.			
#16	Skeptic; Movement; Follow	Observable: Y	Repeatable: Y	Remarkable: Y
Background:	Unexpected movement of inanimate object. Debunking efforts fail. History at childhood home, now this home.			
Biggest claim:	Things move on their own sometimes.			
Skeptical:	There must be a rational explanation; things don’t move on their own.			
Measurement:	GSP			

Appendix 3 - Measurable Reports Summary

#23	Doppelganger; Guardian angel; Visual, Audio; Psychokinesis; SLI; Animals, pets; Follow	Observable: Y	Repeatable: Y	Remarkable: Y
Background:	Couple experiences visual anomalies, ESP, and possible electrical disturbances. History runs 17+ years.			
Biggest claim:	Psychokinesis			
Skeptical:	Coincidence, confirmation bias, false memories, subliminal information gathering, not verifiable.			
Measurement:	Personalized GSP.			
#24	Movement	Observable: Y	Repeatable: Y	Remarkable: N
Background:	Report of feelings of animal walking on bed, when there is none.			
Biggest claim:	Movement			
Skeptical:	Imagination; Misunderstanding natural event			
Measurement:	GSP			
#32	Electrical; Visitation	Observable: Y	Repeatable: Y	Remarkable: Y
Background:	OP's best deceased best friend sends messages. cursory debunking not successful. Repeatable.			
Biggest claim:	Seems interactive.			
Skeptical:	Whatever the case, it's not a ghost.			
Measurement:	GSP; Directed study; Try to communicate.			
#33	Ghost; Audio; Movement; CCTV	Observable: Y	Repeatable: Y	Remarkable: Y
Background:	Security guard reports activity in locked down building, and interactive voice. Routinely happens on CCTV.			
Biggest claim:	Secure environment; Routinely happens on CCTV.			
Skeptical:	Whatever the case, it's not a ghost.			
Measurement:	NLP			

Appendix 3 - Measurable Reports Summary

#44	Moved object; Visual; Audio; Shadow; Faeries; Poltergeist	Observable: Y	Repeatable: Y	Remarkable: Y
Background:	Reports of moved objects, made worse by giving it attention. Ongoing issue.			
Biggest claim:	Moved objects, to reappear in odd places; Recurring.			
Skeptical:	Imagination			
Measurement:	GSP			
#45	Visual	Observable: Y	Repeatable: Y	Remarkable: Y
Background:	Presumably a teen, sees red glowing eyes in various places. Just curious. Parents won't help.			
Biggest claim:	OP asks for "help" with ridiculous claim that happens to be highly measurable.			
Skeptical:	Made-up teenage drama.			
Measurement:	Witnesses; TMP			
#52	Moved object; Electrical; Cold; Audio; Animal, pets	Observable: Y	Repeatable: Y	Remarkable: Y
Background:	History of abundant activity. Moved objects. Not a hint of skepticism.			
Biggest claim:	Moved objects.			
Skeptical:	Imagination			
Measurement:	GSP			
#54	Moved object; Electrical; Body; Movement; Shadow, Visual	Observable: Y	Repeatable: Y	Remarkable: N
Background:	Couple experiences abundant broken things and physical disturbances since moving into new, temp apartment.			
Biggest claim:	Movement correlated with electrical disturbances			
Skeptical:	Imagination and coincidence from the move, and the stress of the move.			
Measurement:	GSP			

Appendix 3 - Measurable Reports Summary

#57	Audio; Visual; Cold; Movement; Moved object; Ghost	Observable: Y	Repeatable: Y	Remarkable: N
Background:	Generational family property has history of abundant observable events, possibly interactive.			
Biggest claim:	Moved objects.			
Skeptical:	Ramblings of kids, and adults. Folklore as self-fulfilling prophecy.			
Measurement:	GSP			
#64	ESP; Meditation	Observable: Y	Repeatable: Y	Remarkable: Y
Background:	Wants advice to debunk episodes of interactive ESP with others.			
Biggest claim:	Interactive ESP with others.			
Skeptical:	Coincidence, power of suggestion.			
Measurement:	Directed study.			
#65	Sleep paralysis; Audio; Body	Observable: Y	Repeatable: Y	Remarkable: Y
Background:	Advice requested about terrifying sleep paralysis episodes as well as waking activity. All activity increasing lately.			
Biggest claim:	Requests help; in distress.			
Skeptical:	Sleep paralysis, power of suggestion.			
Measurement:	GSP			
#66	Moved object; Visual; Baby; Electrical; ESP; Body; Guardian angel	Observable: Y	Repeatable: Y	Remarkable: N
Background:	Lifelong history. Predisposed from baby story. Physical guardian angel experience. Moved objects affecting three.			
Biggest claim:	Moved objects, ongoing.			
Skeptical:	Put it to the test.			
Measurement:	GSP			

Appendix 3 - Measurable Reports Summary

#71	Visual; Electrical; Ouija; Movement; Audio; Apparition; Follow, Ghost; Pre-fear	Observable: Y	Repeatable: Y	Remarkable: Y
Background:	Lifelong history of events. Menacing creatures reported. Affects two. Ongoing.			
Biggest claim:	Movement, also interactive. Ongoing. Likely air quality issue.			
Skeptical:	Imaginations of kids. Air quality.			
Measurement:	GSP			
#74	Shadow; Animal, pets; Sleep paralysis; Doppelganger	Observable: Y	Repeatable: Y	Remarkable: N
Background:	Most recent of ongoing experience of interactive shadow disturbances.			
Biggest claim:	Ongoing interactive shadow disturbances.			
Skeptical:	Imagination			
Measurement:	GSP			
#75	Poltergeist; Movement; Audio; Visual	Observable: Y	Repeatable: Y	Remarkable: Y
Background:	Variety of observable activity at newly rented house.			
Biggest claim:	Movement			
Skeptical:	New environment.			
Measurement:	GSP			
#82	Audio; Follow; Window	Observable: Y	Repeatable: Y	Remarkable: N
Background:	Long history of activity. Ongoing. Reports recent aggressive window noises.			
Biggest claim:	Noise at window some nights.			
Skeptical:	Imagination			
Measurement:	GSP			

Appendix 3 - Measurable Reports Summary

#88	Ghost; Visual; Movement; Follow; Shadow; Door; Body	Observable: Y	Repeatable: Y	Remarkable: Y
Background:	Brother brought home an interactive ghost from work.			
Biggest claim:	Movement. Possibly visual. Ongoing.			
Skeptical:	Drugs, possibly?			
Measurement:	GSP			
#89	Shadow; Shadow person; Mirror	Observable: Y	Repeatable: Y	Remarkable: Y
Background:	History of paranormal. Recent interactive apparition, since innocently moving two mirrors to oppose each other.			
Biggest claim:	Visual disturbances.			
Skeptical:	Day dreaming.			
Measurement:	GSP			
#94	Audio; Lock; Pre-fear	Observable: Y	Repeatable: Y	Remarkable: N
Background:	Lock moves on its own 3x after being double checked.			
Biggest claim:	Lock moves on its own 3x after being double checked.			
Skeptical:	Faulty mechanism.			
Measurement:	Replace lock.			
#99	Body; Angel; Movement; Sleep	Observable: Y	Repeatable: Y	Remarkable: N
Background:	Reported movement.			
Biggest claim:	Moved objects.			
Skeptical:	Normal bumping into things during day.			
Measurement:	GSP			

Appendix 3 - Measurable Reports Summary

#104	Body; Movement; Audio	Observable: Y	Repeatable: Y	Remarkable: N
------	-----------------------	---------------	---------------	---------------

Background: History of paranormal. Recent interaction left bruises.

Biggest claim: Unexpected and unexplained grab and subsequent bruising.

Skeptical: Imagination

Measurement: GSP

#106	Visual; Animal, pets	Observable: Y	Repeatable: Y	Remarkable: N
------	----------------------	---------------	---------------	---------------

Background: In new apartment, various events plus cats disturbed possibly to the point of harm.

Biggest claim: Animals disturbed, possibly to the point of harm.

Skeptical: Coincidence

Measurement: GSP

Remarkable Reports Examination

APPENDIX 4 Remarkable Reports Examination.....	82
I. Recall Relevant Tables.....	82
II. Remarkable Reports Summary.....	83 - 89
III. Raw Data Spreadsheet, Remarkable Reports.....	90 - 101

Recall Relevant Tables:

Table 26 Remarkable Reports.....	43
Table 27 Remarkable Reports – Reason and Testability.....	44

Appendix 4 – Remarkable Reports Summary

#9	Dream, prem; Premonition	◆ ◆ ◆ ◆
Testable:	No. Possibly observable and repeatable but impractical to monitor securely.	
Remarkable:	May be of interest to ESP studies.	
Background:	During a workplace break, OP napped and dreamed of snakes that he was chasing in “the yard.” Later that afternoon OP received a text from sister, the first communication between the two in a few days. The text included a video of sister’s kids from that afternoon’s virtual gym class. The kids were pretending to be snakes, in the yard of OP’s childhood home. OP maintains no prior knowledge of a kids’ snake game. <u>OP maintains this is one of many such pre-cognitive events over the last year.</u>	
Skeptical:	Coincidence, confirmation bias, false memories, subliminal information gathering, not verifiable.	
#11	Visual; Audio; Shadow person	◆ ◆ ◆ ◆
Testable:	No. Impractical to monitor securely.	
Remarkable:	Good example of common report, hits many benchmarks.	
Background:	Example of common complaint of interactive, aggressive creature stalking at 3am. No sleep paralysis.	
Skeptical:	Coincidence, confirmation bias, false memories, subliminal information gathering, not verifiable	
#16	Skeptic, Movement, Follow	◆ ◆ ◆ ◆
Testable:	Yes	
Remarkable:	Skeptic even though appears has a history of un-debunkable events.	
Background:	Unexpected movement of inanimate object. Debunking efforts fail. History at childhood home, now this home.	
Skeptical:	There must be a rational explanation; things don’t move on their own.	

Appendix 4 – Remarkable Reports Summary

#23	Doppelganger; Guardian angel; Visual, Audio; Psychokinesis; SLI; Animal, pets; Follow	◆◆◆◆
Testable:	No; impractical to monitor securely	
Remarkable:	Good example of common report, hits many benchmarks	
Background:	Lots going on here. Taken together there appears (from the context of the report) to be a combination of good and undetermined forces at work, throughout the lives of one couple married 17 years. Wife appears to have slight sixth sense and telekenesis, often concerning electronics.	
Skeptical:	Coincidence, confirmation bias, false memories, subliminal information gathering, not verifiable	
#26	SLI, Tech, Electrical, Luck	◆◆◆◆
Testable:	No, not without certainty of manipulation.	
Remarkable:	May be of interest to ESP studies.	
Background:	Report of breakage of devices, at a greater than random rate. Transference of bad luck from others to himself.	
Skeptical:	Coincidence, self-fulfilling prophecy.	
#27	Visual; Audio; Shadow; Humanoid; Body; Sleep paralysis; Hat man	◆◆◆◆
Testable:	No. Start with air quality.	
Remarkable:	Good example of common report, sounds like air quality issue.	
Background:	Multiple people in house report hat man wandering around at night, with intent to stare at them.	
Skeptical:	Air quality issue.	
#28	ESP; Glitch in Matrix; Deja vu; Hallucination, joint; Train; Astral projection	◆◆◆◆
Testable:	No. Even a dashcam would be questionable.	
Remarkable:	Dual hallucination.	
Background:	Couple reports both seeing the same hallucination while driving together.	
Skeptical:	One-time event. Could have been anything.	

Appendix 4 – Remarkable Reports Summary

#29	Dream, AFTL; Astral projection, ESP, Dream	◆◆◆◆◆
Testable:	No. One-time event.	
Remarkable:	Seems irrefutable but not provable.	
Background:	The night OP’s brother died unexpectedly, they had a mysterious foreboding dream about the brother.	
Skeptical:	Coincidence, power of suggestion, confirmation bias.	
#32	Electrical, Visitation	◆◆◆◆◆
Testable:	Yes	
Remarkable:	Seems interactive.	
Background:	OP’s best deceased best friend sends messages. cursory debunking not successful. Repeatable.	
Skeptical:	Whatever the case, it’s not a ghost.	
#33	Ghost; Audio; Movement; CCTV	◆◆◆◆◆
Testable:	Yes	
Remarkable:	Secure environment; Surveillance already in place.	
Background:	Security guard reports activity in locked down building, and interactive voice. Routinely happens on CCTV.	
Skeptical:	Whatever the case, it’s not a ghost.	
#38	Nightmares; Picture; Water, extra; Gotya; Orbs, Baby	◆◆◆◆◆
Testable:	No	
Remarkable:	So many holes but extremely compelling.	
Background:	Long-running activity suspected of interactively trying to cause death, and finally succeeding.	
Skeptical:	100% of people who are alive will die. If true, this should be testable. Other things easily explainable otherwise.	

Appendix 4 – Remarkable Reports Summary

#39	Audio; Visual; Movement; Animal, pets; Smell; Humanoid	◆◆◆◆◆
Testable:	No	
Remarkable:	Lots going on here. Seems interactive.	
Background:	A lot of bizarre activity. Multiple people. Long, detailed report about childhood home. No activity in current homes.	
Skeptical:	All the usual skeptical reasons of paranormal, plus memory is notoriously unreliable.	
#44	Moved object; Visual; Audio; Shadow; Faeries; Poltergeist	◆◆◆◆◆
Testable:	Yes	
Remarkable:	Moved objects, to reappear in odd places; Recurring.	
Background:	Reports of moved objects, made worse by giving it attention. Ongoing issue.	
Skeptical:	Imagination	
#45	Visual	◆◆◆◆◆
Testable:	Yes	
Remarkable:	OP asks for help with ridiculous claim that happens to be highly measurable.	
Background:	Presumably a teen sees red, glowing eyes in various places. Just curious. Parents won't help.	
Skeptical:	Made-up teenage drama.	
#51	Visual; Flash; Body; Sleep paralysis; Time lost; Forest	◆◆◆◆◆
Testable:	No. One-time event.	
Remarkable:	Physical anomalies/coincidences. Time lost.	
Background:	Encounter in a hunting blind. Lost time noticed by others. Physical body problems next day requiring a doctor.	
Skeptical:	Coincidence, nothing but natural explanations.	

Appendix 4 – Remarkable Reports Summary

#52	Moved object; Electrical; Cold; Audio; Animal, pets	◆◆◆◆
Testable:	Yes	
Remarkable:	Not a hint of skepticism.	
Background:	History of abundant activity. Moved objects. Not a hint of skepticism.	
Skeptical:	Imagination	
#64	ESP; Meditation	◆◆◆◆
Testable:	Yes	
Remarkable:	Interactive ESP with others.	
Background:	Wants advice to debunk episodes of interactive ESP with others.	
Skeptical:	Coincidence, power of suggestion.	
#65	Sleep paralysis; Audio; Body	◆◆◆◆
Testable:	Yes	
Remarkable:	Requests help; in distress.	
Background:	Advice requested about terrifying sleep paralysis episodes as well as waking activity. All activity increasing lately.	
Skeptical:	Sleep paralysis, power of suggestion.	
#70	1 st responder, military, security guard; Phone	◆◆◆◆
Testable:	Maybe, if access.	
Remarkable:	Easy to mistake for paranormal. Obscure natural explanation is likely.	
Background:	Security guard gets phantom phone call from basement, which was empty upon inspection except phone blinking.	
Skeptical:	Basement wiring water damage a common problem known to engineers not laymen.	

Appendix 4 – Remarkable Reports Summary

#71	Visual; Electrical; Ouija; Movement; Audio; Apparition; Follow, Ghost; Pre-fear	◆◆◆◆
Testable:	Yes	
Remarkable:	Movement, also interactive. Ongoing. Likely air quality issue.	
Background:	Lifelong history of events. Menacing creatures reported. Affects two. Ongoing.	
Skeptical:	Imaginations of kids. Air quality.	
#72	Visual; Frost; Spirit	◆◆◆◆
Testable:	No	
Remarkable:	Tried to debunk; Unsuccessful.	
Background:	Frost appears on abode’s floor during overseas death ritual.	
Skeptical:	Must be mistaken or there is a natural reason.	
#76	Video call; Electrical; Cold	◆◆◆◆
Testable:	No. One-time event.	
Remarkable:	Video call anomaly.	
Background:	Menacing video call entity, observed by only one party. Rattled the co-worker who saw it so they cut the call short.	
Skeptical:	Video call anomaly.	
#88	Ghost; Visual; Movement; Follow; Shadow; Door; Body	◆◆◆◆
Testable:	Yes	
Remarkable:	Movement. Possibly visual. Ongoing.	
Background:	Brother brought home an interactive ghost from work.	
Skeptical:	Drugs, possibly?	

Appendix 4 – Remarkable Reports Summary

#96	1 st responder, military, security guard; Door; Audio	◆◆◆◆◆
Testable:	No. Only one report.	
Remarkable:	Interactive	
Background:	Security guard hears door slam in locked-down building. No known drafts. Voice answered clearly when prompted.	
Skeptical:	Normal thing reached tipping point and moved.	
#100	Skeptic; Audio	◆◆◆◆◆
Testable:	No. One-time event.	
Remarkable:	Example of common complaint having an obscure natural explanation.	
Background:	Report of unexpected audio fading into and out of nearby speakers, including clear words at peak.	
Skeptical:	Clear radio interference.

INTRODUCTION

APP's Study #1 found that people appear distressed by “paranormal” events:

In under 34 days late last year, 1,003 paranormal reports were filed to one outlet. Adjusted, that rate would assume over 10,000 per year, to *just one* internet discussion forum.

In the first 100 reports there were no mentions of UFOs, Bigfoot, or various skeptical prizes for paranormal evidence. Primarily referenced were disturbing unexplained events in peoples' homes.

- Over half (60%) expressed distress.
- Over half (57%) requested assistance with the matter.
- For every report an average of 1.72 people were affected.
- Almost two-thirds (67%) expressed skepticism and agnostic beliefs.
- Closer to half but not quite, 40% described ongoing events.
- Over a quarter (26%) of the reports described measurable (observable *and* repeatable) events.
- Three-quarters of Americans believe in at least one paranormal topic.

What can be done about this?

The obvious answer is to bring science to the fore. Skeptics appear to have explanations. Is there a way to jettison this information over the Dunning-Kruger barrier? (Yes, be friendly.)

Besides *pleasant* educational outreach, there is much to be tested. Air quality and video are low hanging fruit, inexpensive and likely to solve many if not a majority of complaints.

In APP's Study #1, several “remarkable” reports offered puzzles for interested skeptics. People seek answers. Skeptics like to solve puzzles. A neutral meeting place could bring solidarity.

With the advent of technology and plethora of resources already available, some *organizational-planning* could bring comfort – via solutions – to distressed paranormal claimants.

The following draft plan strives to address the issue of disturbing unexplained events in peoples' homes.

LITERATURE REVIEW

A. Scientific Explanations

Wiseman, Watt, Stevens, et al (2003) sums up the accepted scientific opinion on the matter:

“These findings strongly suggest that alleged hauntings may not necessarily represent evidence for ‘ghostly’ activity, but could be, at least in part, the result of people responding to ‘normal’ factors in their surroundings.”

In general, scientific explanations for the paranormal range from mental to environmental. Note that five items on the following list are empirically measurable. (Table A1).

Table A1

Scientific Explanations

<u>Live Science 2015</u>	<u>Scientific American 2019</u>	<u>Popular Science 2020</u>
Infrasound	Low frequency sound	You want to believe
Electromagnetic energy	Mold	You’d rather not risk it
Power of suggestion	Carbon monoxide	You need a little company
Misunderstand ambiguous events	The power of suggestion	Your brain is unwell
Optical illusions	Drafts	You’re getting some bad vibrations
False memories	We enjoy being afraid	You’re in the wrong place / wrong time
		Your mind is playing tricks on itself

Sources: Scientific American (Stierwalt, 2019); Live Science 2015 (Pappas, 2015); Popular Science (Bittle, 2020).

These explanations are not without criticism. Public comments on the *Popular Science* list:

“None of this explains why our doorbell used to go off even after we took the batteries out of it. Or how a house full of people heard my grandma who had stage 4 terminal lung cancer scream my moms name at the top of her lungs and when we went to check on her she was dead asleep.”

--- Bree Xo

“None of these explanations solve the mystery of spiritual phenomena caught by methods used by contemporary “ghost hunting” methods such as: camera captures (various types), EVPs, spirit box communication (admittedly flawed), electrical disruptions, etc. With the most convincing being the simultaneous camera captures on multiple cameras with witnesses. As well as the EVPs. Of which, no one has a satisfactory explanation. Dogmatic insistence, aside.”

--- Peaman

B. Psychological Explanations

The Skeptics’ Guide to the Universe tome *How to Know What’s Really Real in a World Increasingly Full of Fake* may be the most comprehensive look at the topic. (Novella et al, 2018). The over-arching premise is that paranormal amounts to misunderstanding natural things. (Table A2). While all valid, to the public these answers may at times seem difficult to understand and apply.

Table A2

Psychological Explanations

<u>Brain Fails</u>	<u>Thinking Fails</u>	<u>Bad Science</u>
1 False Memory	7 Dunning-Kruger Effect	17 Methodological Naturalism
2 Bad Perception	8 Motivated Reasoning	18 Postmodernism
3 Pareidolia	9 Logical Fallacies	19 Occam’s Razor
4 Hyperactive Agency Detection	10 Cognitive Biases	20 Pseudoscience
5 Hypnagogia	11 Appeal to Antiquity	21 Denialism
6 Ideomotor Effect	12 Appeal to Nature	22 P-Hacking
	13 Fundamental Attribution Error	23 Placebo Effects
	14 Anomaly Hunting	24 Anecdote
	15 Data Mining	
	16 Coincidence	

Source: The Skeptics’ Guide to the Universe, *How to Know What’s Really Real in a World Increasingly Full of Fake*. (Excerpt from Table of Contents.)

C. Ghost Hunting

A search of Amazon.com for books related to ghost hunting turned up surprisingly few results. To list them here would display a lack of scientific prowess, embodiment of the echo chamber.

Though skeptical analysis of ghost hunting is almost as sparse, a few exceptions exist. Mr. Benjamin Radford, a research fellow at the Committee for Skeptical Inquiry, has penned many informative (and cheeky) works on the shortcomings of ghost hunting techniques. Among them are *Scientific Paranormal Investigation (2010a)*, *Ghost Hunting Mistakes (2010b)*, *Investigating Ghosts: The Scientific Search For Spirits (2017a)*, and *Are Ghosts Real? Evidence Has Not Materialized (2017b)*. This quote from *Scientific Paranormal Investigation* summarizes the task:

“The cardinal rule is that an investigator must eliminate all the natural explanations before accepting supernatural ones, and must use sound science.” (Radford, 2010a)

The Atlantic’s 2016 *The Broken Technology of Ghost Hunting* critiques the K-II (EMF) meter. The article surmises that, “For the believer, this is where ghosts live: in static, in glitches and in blurs.” (Dickey, 2016). Public anecdotal testimony suggests otherwise, but asserts no *hard* proof.

Joe Nickell’s 2012 *The Science of Ghosts: Searching For Spirits* is also packed with good information. But again this does not *directly* help people who are bothered in their homes.

D. Review: Skeptical Inquirer – Ghost Hunting Mistakes

Review of Article: Ghost Hunting Mistakes

By Benjamin Radford, for The Skeptical Inquirer, November 2010.

<https://skepticalinquirer.org/2010/11/ghost-hunting-mistakes/>

This article was published in 2010, in conjunction with a corresponding book. Have paranormal investigators incorporated this information? The article is not above sarcasm, but is informative.

1. Assuming that no specialized knowledge/expertise is needed to effectively investigate ghosts.
 - Investigation
 - Logic
 - Critical thinking
 - Psychology
 - Science
 - Forensics
 - Other areas
2. Failing to consider alternative explanations for anomalous or “unexplained” phenomena.
 - Process of elimination.
 - EVPs / Voices.
3. Considering subjective feeling and emotions as evidence of ghostly encounters.
4. Using improper and unscientific investigation methods.
 - Lights off
 - Sampling errors
 - Baseline should be dozens, hundreds of data points. GH sample size too small.
 - Statistical averages.
 - Unproven tools and equipment
 - Proven connection to ghosts (em, temp, ion) [BR is working backward].
 - Ineffectively using recording devices
 - Not emf, ion, or other; use reg cam/audio correctly: grid+corners (signal strength).
 - Should find issue immediately not weeks later, so it can be parsed.
5. Focusing on the history of a haunted location instead of the specific phenomena reported at it.
6. Conducting a stakeout or “lock down.”
 - All failed at yielding evidence: A scientific experiment without evidence.
 - Better results if left the lights on.
 - Not controlling the environment but people.
 - Impossibly large range of phenomena = narrow it down then control.

Conclusion of original article *Ghost Hunting Mistakes*:

“Ultimately, of course, whether ghost hunters choose to use scientific methods and strategies is up to them. ... If ghost hunters don’t care about performing scientifically valid investigations ... they can’t complain that no one offered a science-based paradigm for paranormal investigation.”

E. Miscellaneous Fact Finding

Several other factors *bordering* on relevant to this topic cannot be explored fully in this review.

1. The bounds of science, the current scientific rules – Best left to a public education portal.
2. Gadgets and measurement – Methodology panels can uncover best practices.
3. Tone deaf criticism of paranormal – Better evidence is needed to refute criticism.
4. Times science was surprised (not baffled) – Underscores the point that science evolves.
5. Times science was wrong – Underscores the point that science evolves.
6. Unknown vs unknowable – Times science cracked a long-standing academic mystery.

However one particular article espouses most of the above tenets. Scientific American published *Brilliant Scientists Are Open-Minded about Paranormal Stuff, So Why Not You?* By John Horgan on July 20, 2012. (Horgan, 2012).

- Mathematics pioneer Alan Turing’s benchmark opinion that telepathy and telekinesis cannot exist in the same paradigm as natural laws:

“As Turing noted, paranormal phenomena such as telepathy and telekinesis “seem to deny all our usual scientific ideas ... The known laws of physics ... would be one of the first to go.”

- Turing’s benchmark mockery of paranormal:

“It is very difficult to rearrange one's ideas so as to fit these new facts in. Once one has accepted them it does not seem a very big step to believe in ghosts and bogies.”

- Psychological pioneer Psychologist William James’ controversial opinion on evidence:

“So when I turn to the rest of the evidence, ghosts and all, I cannot carry with me the irreversibly negative bias of the 'rigorously scientific' mind, with its presumption as to what the true order of nature ought to be. I feel as if, though the evidence be flimsy in spots, it may nevertheless collectively carry heavy weight.”

- Renowned quantum physicist Freeman Dyson’s 2004 benchmark opinion of paranormal:

“Paranormal phenomena are real but lie outside the limits of science.”

- Nobel Prize winning physicist Brian Josephson’s 1991 controversial opinion of telepathy:

“Yes, I think telepathy exists, and I think quantum physics will help us understand its basic properties.”

From 1991 through 2020 telepathy had not been proven through quantum physics or any other means. In 2021 skeptical prizes still go unclaimed, while affirmative anecdotes still abound.

DISCUSSION OF LITERATURE

The preceding literature describes current scientific knowledge on the subject. However a few facets of the subject escape the literature. This section can be designated as editorial discussion.

A. Tone Deaf Skepticism

Without calling anyone out, some skeptics approach the paranormal without taking into consideration some key factors.

1. Not Clowning Around

A lot of people, real people, are genuinely disturbed by unwanted events in their homes. APP Study #1 was a way to document that. These people are not frauds. They are actively seeking help with debunking. For learned minds to make fun of them borders on unconscionable.

2. Not Against Natural Laws

It is easy to find outliers in the paranormal community that are way out into left field. Cold Fusion is an easy example. However most paranormal claimants, even researchers, are not attempting to re-write the laws of nature. To the contrary, their cumulative point seems to be that mankind has not conquered these (things) as they have with other areas of natural law. Skeptics say it has been proven otherwise. A paper could be written on dissenting scholarly opinion. Therefore the best solution is *more* science, not “close up and go home.”

B. Paranormal Freeze

Without calling anyone out, an abundance of debunking (and science) information is already out there. People seem sincere. One possibility may be cases of “deer-in-the-headlights.” Air quality can cause hallucinations, according to science. So why does the paranormal community almost never speak of this? Possibly people do not know *where to begin* with (real) science.

Could it be that all of the millions, arguably billions, of paranormal experiences throughout history, have not been paranormal? Where is the evidence? With the advent of technology there is no reason for the paranormal community to continue to ignore science.

C. Room For Improvement

Both camps could be more effective. Skeptical information either has not been reaching the paranormal community, or it has not been effective. The paranormal community should be able, in this day and age, to either rid itself of or prove that these things exist.

(DRAFT) LONG TERM PLAN

Where does all this information lead, the *Recent Paranormal Claims Series* and the preceding literature review? It should lead to helping people distressed by “paranormal” events.

A. Proposed Organizational Plan

Abundant resources already exist to debunk “paranormal” events and set peoples’ minds at ease. What is needed is a coordinated effort to bring these resources to the people who need them.

A free and open website can promote networking, education, and methodology discussions. A targeted media campaign can make interested parties aware of the new resource.

Many other avenues are possible: A directed survey of paranormal reports, a library of anecdotes and field researchers, a certification point for investigators, and means of assistance for debunking stubborn cases. In the unlikely event that any withstand debunking, all the better.

The Methodology Panels and Education Portal should remain the pillars. A Paranormal Chair and a Skeptical Chair could exist as largely honorary designations though they may retain veto power, and light managerial roles *if desired*.

A single knowledgeable system administrator could oversee website maintenance as well as the few executive functions a low-key organization might need. All records should be maintained in a reasonably open manner, including certified financial records if applicable.

The organization could be self-sustaining considering the popularity of the topic; and the organization could be self-correcting through public input and more formally, peer review.

Table A3 presents a practical road map.

B. Networking – Open Repository

Such an organization would not be the first of its kind. However a paranormal/skeptical organization would be unique to both speak to the general population on a basic level *and* incorporate the brightest scientific minds. (Table A4). (Table A5).

Skeptics may be most interested in the Methodology Panels and fact checking the educational materials.

Later, in the unlikely event of cases with chronic debunking failure, these could be documented and put through subsequent rounds (methodology planning, measurement, review) until the issue is resolved. Ultimately finding some cases worth passing along to Academia, would amount to the Holy Grail for such a project. (Table A6).

C. Education Portal

The first priority, aside from integrity, should be to meet head-on the needs of the distressed. Some of the ways education can help ease peoples' distress:

Debunking. Plainly articulated, fact filled debunking resources made available and easy to find. A draft debunking brochure has been drawn up, titled *Is Your House Haunted?* It is a colorful five-page read, including scientific and psychological explanations for paranormal, a gadget chart, and a *how-to* list for debunking. A final version would have best practices from the upcoming Methodology Panels. (Exhibit 1 – *Is Your House Haunted?*).

Handbook. With collaboration from scientific stalwarts, a practical field guide to debunking.

Library. Organized by category: Paranormal Anecdotes, useful scientific information, field researchers, and relevant contacts.

APP Courses. A methodology panel will finalize the first draft outlines (already written) for the courses. Designed for those interested in a better understanding of the science and academics of the paranormal, these will be formal primers. Presented in a college course format, each 6-8 week primer will offer a review of the accepted knowledge on a particular topic as it intersects with science. Initial courses involve general academics, science, environmental facets, and scientific investigation. Tentative program ideas include a merit system and certification for successful participants. (Table A7).

In addition to the regular categorized Library, APP Courses, and Methodology Panels, this is a good opportunity to bring science to people who may be interested but do not know where to begin. Table A8 and Figure 1 demonstrate a few high quality, easy-to-digest educational sources.

Investigator Certification. Like the APP Courses, this would be a merit-based certification for interested paranormal investigators who want to showcase their scientific chops. (Table A9). Also subject to methodology panels, we hope skeptics will collaborate to set best practices.

D. Methodology Panels

The second pillar of the organization would be its methodology panels. (Table A10). Best practices have not been established for paranormal investigators, not formally or unilaterally.

Much of this work has already been started by the esteemed researchers mentioned throughout.

With respect to the Center for Inquiry, who offers the current Paranormal Prize, they endeavor to investigate paranormal claims that qualify. However, most people who have paranormal events are just people who want a quick DIY answer to make the event stop. This is not worthy of CFI's attention. But there are untold thousands who could benefit from shared knowledge of best practices for debunking.

Long is the list of planned invitees, including top sources for each camp. (Table A4, Table A5). The methodology forums will be public and all interested skeptics/experts are welcome.

D. Methodology Panels (continued)

Among the first panel topics:

- Self-debunking help. What improvements can be made to the draft instructions? Are there better AQ testing / video options than listed?
- If AQ is clean and video exists, what would be the best way to test an environment for anomalies on a budget? (With the goal of providing an explanation for the event.)
- If AQ is clean and video exists, what would be the best way to test an environment for anomalies if price were no object?
- A grid of sensors has been suggested as effective. Custom modular environmental sensors are available through several vendors. What is the best way to engineer this apparatus?
- Shadows are a persistent complaint. What is the best way to measure shadows? (Saying to ignore it or pointing to psychological answers will come *after* measurement.) Light sensitivity meters should be mounted, replicated, and constant. How to improve?

There are many more questions. And there will be dozens more that better qualify as information sharing (education); people will inevitably suggest things that have been tried/considered before.

So far in the methodology panels / forums has been no mention of the paranormal camp. As skeptics are needed to help apply the scientific method, paranormal participants are needed to provide the cases for examination. The dynamic is paranormal distress –> how to help.

See “Best Cases” below for more on how the paranormal camp contributes to the panels.

All are welcome to participate (skeptical or paranormal) though panel members will have their posts/replies/contributions displayed more prominently. Formal panel members will be determined on an informal, voluntary, rotating basis. There is no limit to the number of panel members except what is logistically practical.

E. Micro-Environment Testing APParatus (M. E. T. A.)

Interested mechanical and electrical engineers are invited to help design a practical gadget system to measure qualities of a micro-environment, i.e. someone’s house. Ideally this would encompass multiple stable A/V inputs plus a suite of air quality measurements, that would track and keep data, ideally in real time to a cloud server for authenticity. This is a very interesting topic, one which deserves its own white paper. A summary of this is demonstrated in the draft debunking brochure. The array and variety of (inexpensive) components available is impressive.

Cynical readers may point out that APP engineering and selling a testing apparatus (or a field handbook) is a capitalist pursuit. Yes, that may be a byproduct of the true motivation. The point is to make it easy and efficient to test paranormal claims, which should help ease peoples’ stress.

F. Best Paranormal Claims Review

The most fun of the website/organization might be the best claims review. Paranormal participants, both individuals and organizations, will be welcome to contribute their best *on-going* claims for debunking help. Participants must go through self-debunking steps first. Then a skeptical panel can give custom advice and later follow up. A beginning outline of this program has been drafted. (Table A11). In the unlikely even that remote assistance fails, a team of certified investigators could be dispatched to collect more measurements, to verify or dispel. This entire process may take a reasonable length of time as there are many steps to implement.

G. Remainder Sample Queue (APP Study #2)

APP Study #1 was the first round, the first 100 reports in a queue of 1,003. Releasing the first round allows the opportunity for feedback on its methodology. The remaining queue will be processed according to honed guidelines established with insightful feedback. The feedback period on Study #1 will remain open for two months before the analysis proceeds.

H. Directed Survey (APP Study #3)

Eyewitness testimony (anecdotal evidence) is not the optimal test method. However polls can be enlightening if executed properly. A directed survey is planned to expand on the criteria assessed in Studies #1 and #2. Benefits include a wider sample and more comprehensive data. Location, distress, frequency, descriptors, debunking, and other facets can be explored more completely.

As a prelude to methodology discussions on best practices for the directed survey, one detailed resource stands out. The Pew Research Center published a helpful asset called *Questionnaire Design*. (Pew, 2021.) This expansive document details in great length the *hows* and (just as important) *whys* of effective poll design, to best obtain accurate results.

A draft of this directed survey is currently available at the website.

I. Academic Review (APP Study #4)

In looking forward to cover contingencies we may eventually compile a queue of stubborn cases that resist debunking. These cases would arise after passing self-debunking, the *Best Paranormal Claims Review*, and independent verification. If any such cases exist, we expect to compile them for consideration by interested academic publications. It is premature to speculate further.

J. Journal – APP Quarterly

“The difference between science and screwing around is writing it down.” This profound statement is attributed to *The Great Adam Savage*, of MythBusters fame. (Savage, 2021). Regular status reports can detail the metrics of APP’s progress.

J. Journal – APP Quarterly (continued)

More importantly, paranormal researchers are frequently lambasted by skeptics for shoddy research methods. One component of the problem is “pay-to-play” journals where anyone with the admission fee can have their work published – no questions asked. While open resources are good, a general lack of formal review works against the researcher who wishes to grow.

This is a fertile area for the subject of Paranormal. There are many paranormal experts who assert hypotheses and express a desire to suss out an issue, regardless of the outcome. Likewise there are scientific experts and academics willing to engage in *politely* critiquing paranormal theories. Of course many paranormal researchers will shun the idea of academic criticism. Researchers interested in *constructive* feedback will have a venue through the APP Quarterly.

A process will be determined appropriately for admission requirements, reviews, and publication.

K. Public Outreach

What good is all the information in this draft plan, or the draft plan itself? The mission is to help ease peoples’ distress at paranormal events. After a solid framework is in place, for debunking information and methodology forums, outreach can begin toward the public (both camps).

Social media advertising is relatively inexpensive. (WebFX, 2021). The wide appeal of the topic ensures mass exposure. (Harnil, 2018). Invitations to major and minor organizations relevant to these topics, can be issued to both paranormal and skeptical camps.

L. Self-Correcting (Oversight)

The phrase “herding cats” may well apply to this endeavor. Major areas of concern are promoting good science, good faith (ethics), and a *friendly* atmosphere.

There are scores of paranormal topics and a low level of science proficiency among the public. Upon sign-up to the website that serves as APP’s public portal, the tenets above are made clear. Moderators will be appointed appropriately. Educational material will be constantly highlighted.

Another major concern is maintaining academic credibility, meaning scientific policies that work within the bounds (review, improve, repeat) of Academia. Public input, peer review, and a ratings system can contribute to the self-correcting nature of the organization.

M. Self-Sufficient

At onset, the organization and website would incur minimal overhead. Studies and management can be handled by *appropriate* volunteers. The paranormal is a popular topic. Social media advertising is inexpensive. Self-sufficiency could be achieved with few donations. A small promotional “Date-Book” campaign is planned to secure television advertising and start the field book. The (META) APParatus engineering will require more fundraising, at the appropriate time.

CONCLUSION

The Aster-P Project is neither the first nor the last to attempt to bridge the gap between science and paranormal. Its entire scheme may be viewed by some as just another “crackpot” endeavor.

However, skeptics approach the paranormal without taking into consideration some key factors. A lot of real people are genuinely disturbed by unwanted events in their homes. These people, for the most part, are not frauds. They also actively seek help with debunking. For learned minds to point and make fun of them borders on unconscionable.

Both camps could be more effective. Skeptical information either has not been reaching the paranormal community, or it has not been effective. The paranormal community should be able, in 2021, to either rid itself of, or prove that these things exist.

The best option to help may be a combination of education, advertising, and cooperation between “experiencers” and skeptics to figure out tough cases. This draft long-term plan provides a starting point and a route for bringing the two camps together.

- Volunteer-Based, Science-Minded, People-Oriented
- Networking – Open Repository (website)
- Education Portal (debunking library, handbook, courses, investigator certs)
- Methodology Panels (this/other research, debunking, testing)
- Micro-Environment Testing Apparatus (META)
- Best Paranormal Claims Review
- Remainder Sample Queue (APP Study #2)
- Directed Survey (APP Study #3)
- Academic Review (APP Study #4)
- Quarterly Journal (with panel of reviewers)
- Outreach Plan
- Self-Correction (through peer review)
- Self-Sufficient (meager needs met via small donations)

The best solution is *more* science, not “close up and go home.” Let us work together.

Exhibit 1

Draft Debunking Brochure: Is Your House Haunted

The following is is not a real brochure. It is a draft to spur suggestions.

More to the point, the idea of a brochure is in keeping with the conclusion that people would benefit from scientific assistance with paranormal claims.

It is true that this brochure does not have the best debunking information *yet*. Thoughtful commentary can help shape the final draft into a useful product.

Experts may create far better resources. APP will hold no grudge. The goal is “best practices.”

Themes of a debunking brochure should include:

- short, easy-to-understand document
- practical ideas, things that can be done realistically, without much delay
- best ways to monitor the various components of an environment
- how to *succinctly* combat psychological components / misunderstandings

Is Your House Haunted?

Are you **bothered** by something you can't explain?
Science says you're imagining it, or misunderstanding the real cause.
But you're not trying to have an issue, right? So how can you fix it?

1. Check Your Psyche

There's a **laundry list** of ways that skeptics say you're imagining the issue.
Most people don't think they're imagining things. So check the environment too.

2. Check Your Environment

It's relatively cheap and easy to test all the explanations science has:

(NOTE: We DO NOT sell anything. Links are only for your convenience.)

- **Low Frequency Sound** – (free phone apps)
- **Mold** – (\$8 kit at Home Depot)
- **Carbon Monoxide** – (\$20 gadget at Home Depot)
- **Drafts** – (\$15 gadget at Amazon)
- **Electromagnetic Energy** – (\$30 gadget at Amazon)
- Video/Audio record securely with a \$99 (Ring, Inc.) cam

See Detailed List ----->

*And if you can't debunk it... maybe you could try for the CFI prize. (THIS IS **NOT US!**)
We are NOT these people. But they are offering \$250,000 for proof of the paranormal.
Check them out at: <https://cfiig.org/250k-challenge>*

Check Science’s Explanations for Paranormal Events:

We researched gadgets for cost and availability. (We do NOT benefit from these sources!)

Measure This:	Cheap Gadget	Cost	Better Gadget	Cost	Third Party	Cost
Scientific Explanations						
Low freq. / Infrasound	r1	free	r2	< \$500		
Electromagnetic energy	r3	< \$30	r4	< \$150		
Mold	r5	< \$10	r6	< \$150		
Carbon monoxide	r7	< \$20	r8	< \$350		
Drafts	r9	< \$30	r10	< \$150		
Home Monitoring System						
Audio	r12, 1x	\$100-\$200	r11, 4x	< \$250	r12, 2x	\$300-\$600
Visual	r12, 1x	(included)	r11, 4x	(included)	r12, 2x	(included)
Motion	r12, 1x	(included)	r11, 4x	(included)	r12, 2x	(included)
Subscription	r13, 1x	< \$11/mo	--	--	r13, 1x	< \$11/mo
Other Environmental Stats						
Humidity	r9	(included)	r10	(included)		
Air pressure	r9	(included)	r10	(included)		
Temperature	r9	(included)	r10	(included)		
Air speed	r14	< \$15	r15	< \$100		
Radon	r16	< \$20	r17	< \$140		
AQI 9-in-1	--	--	r8	(included)		

This is a general list from mass market vendors to demonstrate wide availability.

Not an exhaustive list, just helpful suggestions to get you started customizing a plan for your situation.

Psychological Explanations for Paranormal Events:

1-12 of 24

Summary and basic links. Highly recommended to read these sections in:

[The Skeptics' Guide to the Universe, How to Know What's Really Real in a World Increasingly Full of Fake.](#)

1 [False Memory](#)

https://en.wikipedia.org/wiki/False_memory

There are some very good reasons why memory cannot be trusted.

2 [Bad Perception](#)

<https://www.scientificamerican.com/article/do-the-eyes-have-it/>

There are some very good reasons why eyewitness testimony is unreliable.

3 [Pareidolia](#)

<https://en.wikipedia.org/wiki/Pareidolia>

When people see faces in clouds, or guess at an ink-blot test.

4 [Hyperactive Agency Detection](#)

https://religions.wiki/index.php/Agent_detection_bias

When something random happens and one attributes it to God, or a ghost, instead of (gravity).

5 [Hypnagogia](#)

<https://en.wikipedia.org/wiki/Hypnagogia>

That weird state between awake and asleep. The body and mind do unsettling things.

6 [Ideomotor Effect](#)

https://en.wikipedia.org/wiki/Ideomotor_phenomenon

This is the explanation for Ouija boards and dowsing, among other movement-based events.

7 [Dunning-Kruger Effect](#)

https://en.wikipedia.org/wiki/Dunning%E2%80%93Kruger_effect

The more ignorant a person is, the smarter they think they are. It has been proven.

8 [Motivated Reasoning](#)

https://en.wikipedia.org/wiki/Motivated_reasoning

When one makes excuses, or reasons, for a (negative) thing just because they like it.

9 [Logical Fallacies](#)

<https://thebestschools.org/magazine/15-logical-fallacies-know/>

Brain fails, common errors in judgment. Wide, wide subject.

10 [Cognitive Biases](#)

https://en.wikipedia.org/wiki/List_of_cognitive_biases

All the different ways a brain misunderstands what it senses.

11 [Appeal to Antiquity](#)

https://en.wikipedia.org/wiki/Appeal_to_tradition

Because that is the way we always do it, it must be the best way.

12 [Appeal to Nature](#)

https://en.wikipedia.org/wiki/Appeal_to_nature

Something is good just because it is natural, with no other evaluation.

Psychological Explanations for Paranormal Events:

13-24 of 24

Summary and basic links. Highly recommended to read these sections in:

[The Skeptics' Guide to the Universe, How to Know What's Really Real in a World Increasingly Full of Fake.](#)

13 [Fundamental Attribution Error](#)

https://en.wikipedia.org/wiki/Fundamental_attribution_error

When retelling a story, people make themselves sound closer to their ideals than reality.

14 [Anomaly Hunting](#)

<https://en.wikipedia.org/wiki/Anomalistics>

Anomalies are real, but more things are not anomalies.

15 [Data Mining](#)

<https://qz.com/1664575/is-data-science-legit/>

Valid in business. In science it means using only the data that supports your preconceived view.

16 [Coincidence](#)

<https://www.psychologytoday.com/us/blog/connecting-coincidence/201607/there-are-no-coincidences>

The world is a random place.

17 [Methodological Naturalism](#)

https://rationalwiki.org/wiki/Methodological_naturalism

Valid some times but not as an excuse to ignore inconvenient facts.

18 [Postmodernism](#)

<https://areomagazine.com/2018/04/28/skepticism-is-necessary-in-our-post-truth-age-postmodernism-is-not/>

In this context: Science is modern, so post-modernism = science is “words about nothing.”

19 [Occam's Razor](#)

<https://www.theatlantic.com/science/archive/2016/08/occams-razor/495332/>

A thoughtful article on a dusty tenet.

20 [Pseudoscience](#)

<https://en.wikipedia.org/wiki/Pseudoscience>

Doing science wrong.

21 [Denialism](#)

<http://ossfoundation.us/projects/environment/global-warming/myths/denialist-vs.-skeptic>

Those skeptical of established science are not skeptics, they are denialists.

22 [P-Hacking](#)

https://en.wikipedia.org/wiki/Data_dredging

One of many ways that “scientific studies” can be manipulated to the researcher’s whim.

23 [Placebo Effects](#)

<https://www.health.harvard.edu/mental-health/the-power-of-the-placebo-effect>

Positive thinking?

24 [Anecdote](#)

https://en.wikipedia.org/wiki/Anecdotal_evidence

There are a lot of reasons why anecdotal evidence is unreliable.

Measurement Tips

Recommended Methods:

1. Get an air quality monitor. If you can, spend the \$300 on a 9-in-1. It does everything.
2. At least do cheap tests for mold, CO₂, and radon; and consider a handheld \$30 AQM.
3. Get a Ring System (or similar), 1-2 cameras (per room) for A/V, storage, and motion.
4. Control the environment. The less variables you have to rule out, the easier the job.
5. Start with these things. If you still have problems, use more gadgets to isolate the issue.
6. Document everything!

Caution About Gadgets:

So many gadgets! If you can't do the jumbo \$300 all-in-one Air Quality Meter, each of the components individually have plenty of cheap options. The downside is you have to check and coordinate *each* of those separately. In cheap options, look for apps to log data.

AQMs measure particulates, gasses, temperature, humidity, and air pressure. Cameras from a Ring-like system measure A/V and are motion activated. Data is logged in cloud.

Do those first. Then: EM and RF radiation, infrasound, wind speed, and light saturation.

Extra Tips:

- If you just want to make the ghost go away, try making a big show of surveillance. (Because ghosts hate attention right? This is not a flippant comment. We are serious.)
- Learn how the instrument works, its thresholds. And, Google to find out *why* to test this.
- A handheld AQI (\$30) is good for other reasons. New furniture and paint have fumes.
- Set up your instruments so if motion clicks the camera on, it will record the displays of the instruments. Not as easy as it sounds, most gadgets' screens go dark if inactive.
- Establish baselines. Lots of readings in lots of places lets you recognize "unusual."
- Once you measure and find something, systematically rule out all possible explanations.

The Aster-P Project endeavors to make this process easier, to help people bothered by paranormal events.

Share your results with us, or get more information, at www.asterpp.org

ACKNOWLEDGMENTS

Thank you to the Paranormal community. This project is meant to help us all, not to condescend.

Thank you to Reddit.com and their r/paranormal, *and the users*, for providing source material.

Thank you to the Skeptical community, for keeping criticism constructive and good-natured.

Thank you to Dr. Steven Novella, Bob Novella, Cara Santa Maria, and Evan Bernstein, the Skeptics' Guide to the Universe, for your work to produce a highly educational podcast.

Thank you to Mr. Benjamin Radford, for publishing so much good information on ghost hunting.

Thank you to the late Art Bell, Coast to Coast AM, Mr. George Noory, and all the hosts and crew; you are an institution and have chronicled all things the paranormal for 50+ years.

Thank you to Mr. Dave Schrader and Darkness Radio, "*The Best in Paranormal Talk Radio.*"

Thank you to Wikipedia, Jimmy Wales, and Contributors. You are doing commendable work.

Thank you to Mr. Chris A. Mack, author of "How to Write a Good Scientific Paper." (2018).

Thank you to the *many* APA style guides on the internet, and of course *Purdue's* OWL.

Thank you to LibreOffice, for the open source software.

Thank you to University of Phoenix ("You'll get out out it, an exponent of what you put into it.")

Thank you to MD, study administrator and copy editor.

Thank you to ~~everyone~~ anyone who might take this project seriously.

The Aster-P Project extends
Appreciation and Gratitude
to all those listed above.

You have been instrumental in our project.

THANK YOU
